I added 1.1g of tape to the blade tips, and 4.75g of solder on the flybar just inboard of each paddle. Results? Rock solid stability, at the expense of quick cyclic of course.

I was contemplating buying a Hirobo XRB for indoor only, but after trying this mod out, there's no reason to.

- Add weight to the rotor system increases stability, heavier paddles and blades

- Use inner most servo holes

- Add lots of negative expo to the cyclic and/or reduce rates and/or reduce swash Tx setup values.

- Try softer throttle and pitch curves

- Remove Beller Hiller links

Hornet X 3D Twister(Axi 2208/20, Tsunami), MS-116 ESC, MS-044 gyro, KOK Extrême white blades, 3xTP1320 prolites ~15mins, AUW=375g. Futaba7C
